In other words, if I have a size of 5, does it mean that the constructor is called 5 times and each time it passes the same object? A: The `this.objects = new MyClass[size]` will call the constructor 5 times. The first time you call that, you have that: `this.objects = new MyClass[size];` You initialise an array of size that is the same as the instance of `MyClass`. This will call the constructor 5 times. You then call a method on the instance, `this: objects = new MyClass[size];` This initialises a new array, of size to be the same as the instance, containing references to 5 new instances of `MyClass`. Now you do something with the array: `for(int i = 0; i`
